

# GitHub practical

## PART 0: Check if git is installed and if not, install it

1. Git is installed by default on Mac and Linux systems.
2. In Windows: Go to a Command Prompt window and type: `git --version`
3. If not, then go to: <https://git-scm.com/download/win> and run the download. Accept all default options.

## PART 1: Create a GitHub account and create a repository

1. Create a GitHub account at: <https://github.com/signup> Use your NTU address for an academic account.
2. When logged in, find the green "New" button to create a new repository
3. Give it a name: "test\_repo" and a description.
4. Make it public
5. Press create.

## Part 2: Install GitHub Desktop

1. Go to <https://desktop.github.com/download/> download GitHub Desktop.
2. Sign in your account
3. File > Clone the repository, select the repo you just create online. Choose where you are going to save it.
  - Please do not save it on a network drive, eg Dropbox/Google drive.
4. In the local folder, create a txt file and write some random words.
5. Move back to GitHub Desktop. What did you see?
6. Write some simple words describing what you just added. Then click Commit.
7. Push the commit.
8. Check on GitHub.com to see if the commit has appeared.
9. Make some more changes to the script, commit them, and push them.

Well done!
